

TAS576xM 2x50-W/4-Ω PurePath™ Smart Amp

1 Features

- PurePath Smart Amp:
 - Optimizes and Protects Dynamic Loudspeakers
 - Bass Q-compensation and Frequency Extension: More Loudness, Bass Enhancement, Better Clarity and Higher Fidelity.
 - Thermal and Excursion Limitation.
- Stereo Class-D Amplifier With:
 - Wide Power Supply Range: 4.5 V – 26.4 V
 - Wide Load Range: 2 Ω – 8 Ω;
 - High output current: 2x 7.5 A
 - Peak output power 2x 50 W/4 Ω
 - Continuous Power: 2x 20 W w/o heat sink
 - Click and Pop free: Power, Mute and Standby ON/OFF
 - Low Output Noise: <60 μVrms at 12 V-supply, <90 μVrms at 24-V supply
 - Low THD+N: <0.02% at 1 W/4 Ω, 1 kHz
 - Thermal, Over-Current and Short-Circuit Protected
- Configurable Digital Audio Processor.
 - Down Mixing and Custom EQ with 10 BiQuads
- Digital Audio Interface: I²S or TDM input w.
 - 44.1 kHz and 48 kHz FS
 - Configurable Digital Output
- Multisegment DAC with Excellent Jitter Suppression
- Integrated High-Performance Audio PLL
- I²C control
- 48-pin PowerPAD™ HTSSOP or VQFN Package

2 Applications

- Audio Docks
- Soundbars
- Laptops
- All-In-One Computers
- Digital TVs

3 Description

The TAS576xM PurePath Smart Amp enhance the bass, sound fidelity and provide more loudness and at the same time drive a speaker to its thermal and mechanical limits.

The TAS576xM contains two BTL class-D amplifiers – with up to 2x50W peak into 4Ω. The amplifier is thermally designed to fit with the typical speaker so it can handle high peaks for the time it takes the speaker voice-coil to heat up, and then it lowers the average power to safe limits.

The wide supply range of 4.5 V to 26.4 V enables the use of a wide range of different power supply options from 2-cell Li-Ion batteries to fixed 24 V supply.

TI's PurePath Smart Amp technology allow speakers to be driven with more peak power than their average power rating, without fear of damage to the speaker through over excursion or thermal-overload.

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
|-------------|-------------|--------------------|
| TAS5766M | HTSSOP (48) | 12.50 mm × 6.10 mm |
| TAS5768M | VQFN (48) | 7.00 mm × 5.00 mm |

(1) For all available packages, see the orderable addendum at the end of the datasheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from Revision C (September 2014) to Revision D | Page |
|--|-----------|
| • Added paragraph to clarify the 3-wire mode of I2S operation..... | 41 |

| Changes from Revision B (September 2014) to Revision C | Page |
|---|-----------|
| • Added NOTE and additional descriptive text to Applications and Implementation section. | 39 |
| • Moved Detailed Register Map Descriptions section | 51 |

| Changes from Revision A (June 2014) to Revision B | Page |
|---|-----------|
| • Added descriptions for CDST[5] through CDST[0] in Register 94 (Hex 0x5E); and changed Bit 6 description from CDST[6:0] to CDST[6]. | 69 |

| Changes from Original (September 2013) to Revision A | Page |
|---|----------|
| • Revised data sheet to new format; added Device Information table to first page..... | 1 |
| • Added TAS5768M device | 1 |
| • Added RMT package option | 1 |

5 Pin Configuration and Functions

TAS5766M, TAS5768M

SLAS965D – SEPTEMBER 2013 – REVISED OCTOBER 2018

Pin Functions

| SYMBOL | HTTSOP PIN No. | VQFN PIN No. | TYPE ⁽¹⁾ | DESCRIPTION |
|----------------|---------------------------------|---|---------------------|--|
| ADR1 | 26 | 45 | I | LSB address select bit for I ² C |
| ADR2 | 20 | 39 | I | 2nd LSB address select bit for I ² C |
| AVCC | 41 | 12 | PI | Analog Supply – connect to PVCC |
| AVDD | 14 | 33 | PI | Analog Supply |
| BCLK | 23 | 42 | I | Audio data bit clock input |
| BSNL | 48 | 19 | BST | Boot strap negative Left channel output, connect to 220 nF X7R ceramic cap to OUTNL |
| BSNR | 1 | 20 | BST | Boot strap negative Right channel output, connect to 220 nF X7R ceramic cap to OUTNR |
| BSPL | 44 | 17 | BST | Boot strap positive Left channel output, connect to 220 nF X7R ceramic cap to OUTPL |
| BSPR | 5 | 22 | BST | Boot strap positive Right channel output, connect to 220 nF X7R ceramic cap to OUTPR |
| CAPM | 34 | 5 | | Charge pump flying capacitor pin for negative rail |
| CAPP | 32 | 3 | | Charge pump flying capacitor pin for positive rail |
| CPVDD | 31 | 2 | PI | Charge pump power supply, 3.3 V |
| DACL | 36 | 7 | O | Analog output from DAC left channel, ground centered |
| DACR | 13 | 32 | O | Analog output from DAC Right channel, ground centered |
| DIN | 24 | 43 | I | Audio data input |
| DVDD | 30 | 1 | PI | Digital power supply, 3.3 V |
| FAULT | 40 | 11 | OD | General fault reporting, Open Drain, High = normal operation, Low = fault condition |
| GAIN/FSW | 9 | 28 | I | Sets power stage Gain and selects output switching frequency |
| GND | 3, 10, 15, 29, 33, 39, 46 | 4, 10, 14, 15, 24, 25, 29, 34, 48 | G | Ground |
| GPIO1 | 18 | 37 | I/O | General purpose digital input and output port |
| GPIO2 | 19 | 38 | I/O | General purpose digital input and output port |
| GPIO3 | 21 | 40 | I/O | General purpose digital input and output port |
| GVDD | 8 | 27 | PBY | Internal Gate drive supply, connect 1uF to GND |
| INN1 | 38 | 9 | I | Negative audio input for Left channel. Internally biased at 3 V |
| INN2 | 11 | 30 | I | Negative audio input for Right channel. Internally biased at 3 V |
| INPL | 37 | 8 | I | Positive audio input for Left channel. Internally biased at 3 V |
| INPR | 12 | 31 | I | Positive audio input for Right channel. Internally biased at 3 V |
| LDOO | 28 | 47 | PBY | Internal logic supply rail pin for decoupling, 1.8 V, connect 1 µF to GND |
| LRCLK | 25 | 44 | I | Audio data word clock input |
| OUTNL | 47 | 18 | PO | Negative Left channel output |
| OUTNR | 2 | 21 | PO | Negative Right channel output |
| OUTPL | 45 | 16 | PO | Positive Left channel output |
| OUTPR | 4 | 23 | PO | Positive Right channel output |
| PVCC | 6, 7, 42, 43 | 13, 26 | PI | 4.5-V to 26.4-V Power supply |
| SCL | 17 | 36 | I | Input clock for I ² C |
| SCLK | 22 | 41 | I | System clock input (also referred to as master clock input) |
| SDA | 16 | 35 | I/O | Input data for I ² C |
| Thermal pad | 49 | 49 | G | Connect Thermal Pad to Ground |
| VNEG | 35 | 6 | PO | Negative charge pump rail pin for decoupling –3.3 V |
| XSMUT/UVF | 27 | 46 | I | Soft mute control : Soft mute (Low) / soft un-mute (High) |

(1) TYPE: BST=Boot Strap, PO=Power Output, G = General Ground, I= Input, O= Output, I/O = Input or Output, , PBY=Power Bypass, , PI=Power Input,.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

| | | MIN | MAX | UNIT |
|---------------------------------------|--|------|----------|------|
| V _{CC} | Supply Voltage: PVCC, AVCC | −0.3 | 30 | V |
| | AVDD, DVDD, CPVDD | −0.3 | 3.9 | V |
| V _I | Input Voltage: INPL, INNL, INPR, INNR | −0.3 | 6.3 | V |
| | Input Voltage: GAIN/FSW, $\overline{\text{FAULT}}$ | −0.3 | GVDD+0.3 | V |
| | Digital Input Voltage: DVDD=3.3V | −0.3 | 3.9 | V |
| T _A | Operating free-air temperature | −40 | 85 | °C |
| T _J | Operating Junction temperature, digital die | −40 | 125 | °C |
| | Operating Junction temperature, power die | −40 | 150 | °C |
| Storage temperature, T _{stg} | | −40 | 125 | °C |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

| | | | VALUE | UNIT |
|-----------------------------------|-------------------------|--|-------|------|
| V _(ESD) ⁽¹⁾ | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽²⁾ | ±2000 | V |
| | | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽³⁾ | ±500 | |

- (1) Electrostatic discharge (ESD) measures device sensitivity and immunity to damage caused by assembly line electrostatic discharges in to the device.
- (2) Level listed above is the passing level per ANSI, ESDA, and JEDEC JS-001. JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (3) Level listed above is the passing level per EIA-JEDEC JESD22-C101. JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | | MIN | TYP | MAX | UNIT |
|--------------------|----------------------------|---|-----|-----|------|------|
| V _{CC} | Supply Voltage | PVCC, AVCC | 4.5 | | 26.4 | V |
| V _{DD} | | AVDD, DVDD, CPVDD | 3 | 3.3 | 3.6 | |
| V _{IH} | High level input voltage | | 2 | | | V |
| V _{IL} | Low level input voltage | | | | 0.8 | V |
| V _{OL} | Low level output voltage | $\overline{\text{FAULT}}$, R _{pullup} = 100 kΩ, PVCC = 26 V | | | 0.8 | V |
| R _L | Minimum load impedance | PVCC = 24 V | 3.2 | 4 | | Ω |
| | | PVCC = 18 V | 2.5 | 3 | | |
| | | PVCC = 12 V | 1.8 | 2 | | |
| | | PVCC = 6 V | 0.9 | 1 | | |
| R _{L_PBT} | PBT Minimum load impedance | PVCC = 24 V | 1.8 | 2.2 | | Ω |
| | | PVCC = 18 V | 1.4 | 1.6 | | |
| | | PVCC = 12 V | 1.0 | 1.2 | | |
| | | PVCC = 6 V | 0.5 | 0.6 | | |
| Lo | Output filter inductance | Minimum output filter inductance under short-circuit condition | 1 | 4.7 | | μH |

6.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | TAS576xM | | UNIT |
|-------------------------------|--|----------------------------|----------------------------|------|
| | | RMT (48 PINS) | DCA (48 PINS) | |
| | | 4 LAYER PCB ⁽²⁾ | 2 LAYER PCB ⁽³⁾ | |
| R _{θJA} | Junction-to-ambient thermal resistance | 30 | 30 | °C/W |
| R _{θJC(top)} | Junction-to-case (top) thermal resistance | 15 | 14 | |
| R _{θJB} | Junction-to-board thermal resistance | 6 | 13 | |
| Ψ _{JT} | Junction-to-top characterization parameter | 0.2 | 0.6 | |
| Ψ _{JB} | Junction-to-board characterization parameter | 6 | 13 | |
| R _{θJC(bot)} | Junction-to-case (bottom) thermal resistance | 1.9 | 0.7 | |

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

(2) For the PCB layout see the TAS576xMRMTEVM User Guide. A 4 layer 60x60mm 1oc PCB was used

(3) For the PCB layout see the TAS576xMDCAEVM User Guide. A 2 layer 60x60mm 1oc PCB was used

6.5 DC Electrical Characteristics

All specifications at T_A = 25°C, AVDD = CPVDD = DVDD = 3.3 V, f_S = 48 kHz, system clock = 512 f_S and 24-bit data, V_{CC} = 12 V to 24 V, R_L = 4 Ω (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---------------------|---|--|-----|-----|-----|------|
| VOS | Class-D output offset voltage (measured differentially) | PV _{CC} = 12 V, gain set to 14 dB | | 1 | 10 | mV |
| | Input is Bipolar Zero data | PV _{CC} = 24 V, gain set to 20 dB | | 1.5 | 15 | mV |
| R _{DS(on)} | Drain-source on-state resistance, measured pin to pin | V _{CC} = 24 V, I _{out} = 500 mA, T _J = 25°C | | 120 | | mΩ |
| G | Analog Gain from INxx to OUTxx | Gain pin voltage < 3 V | 13 | 14 | 15 | dB |
| | | Gain pin voltage > 3.3 V | 19 | 20 | 21 | dB |
| t _{on} | Turn-on time | XSMT = 2 V | | 1.5 | | ms |
| t _{OFF} | Turn-off time | XSMT = 0.8 V | | 0.8 | | ms |
| GVDD | Gate Drive Supply Voltage | IGVDD ≤ 200 μA | | 6.9 | | V |

6.6 AC Electrical Characteristics

All specifications at $T_A = 25^\circ\text{C}$, $AVDD = CPVDD = DVDD = 3.3\text{V}$, $f_s = 48\text{kHz}$, system clock = $512f_s$ and 24-bit data, $V_{CC} = 12\text{V}$ to 24V , $R_L = 4\ \Omega$ unless otherwise noted

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-----------|--|---|-----|-------|-----|---------------|
| K_{SVR} | Power supply ripple rejection | 200 mV _{PP} ripple at 1 kHz, gain = 20 dB, zero input signal | | –60 | | dB |
| P_O | Peak output power | THD+N = 10%, 1 kHz, 24-V supply, 8- Ω load | | 30 | | W |
| | | THD+N = 10%, 1 kHz, 24-V supply, 4- Ω load | | 50 | | W |
| F_{sw} | Output switch frequency multiple of FS Gain set to 14 dB | Ra = 100 k Ω , Rb = open | | 8 | | |
| | | Ra = 20 k Ω , Rb = 100 k Ω | | 10 | | |
| | | Ra = 39 k Ω , Rb = 100 k Ω | | 12 | | |
| | | Ra = 47 k Ω , Rb = 75 k Ω | | 16 | | |
| F_{sw} | Output switch frequency multiple of FS Gain set to 20 dB | Ra = 51 k Ω , Rb = 51 k Ω | | 8 | | |
| | | Ra = 75 k Ω , Rb = 47 k Ω | | 10 | | |
| | | Ra = 100 k Ω , Rb = 39 k Ω | | 12 | | |
| | | Ra = 100k Ω , Rb = 20 k Ω | | 16 | | |
| THD+N | Total Harmonic Distortion + Noise | 1W, 1 kHz, 4R load, 12 V supply | | 0.05% | | |
| | | 1W, 1 kHz, 8R load, 24 V supply | | 0.05% | | |
| V_N | Output integrated noise | 20-22 kHz, A-weighted, 14 dB gain, 12 V supply | | 60 | | μV |
| | | 20-22 kHz, A-weighted, 20 dB gain, 24 V supply | | 85 | | μV |
| SNR | Signal to Noise Ratio | 20-22 kHz, A-weighted, 14 dB gain, 12 V supply | | 103 | | dB |
| | | 20-22 kHz, A-weighted, 20 dB gain, 24 V supply | | 106 | | dB |
| | Crosstalk | $V_O = 1\ V_{rms}$, 20 dB gain, 1 kHz, 4- Ω load | | –90 | | dB |
| I_P | Peak output current | 1 kHz, 10 ms, 3- Ω load, 24-V supply | | 7.5 | | A |

6.7 Electrical Characteristics

All specifications at $T_A = 25^\circ\text{C}$, $AV_{DD} = CPV_{DD} = DV_{DD} = 3.3\text{ V}$, $f_S = 48\text{ kHz}$, system clock = $512 f_S$ and 24-bit data, $V_{CC} = 12\text{ V}$ to 24 V , $R_L = 4\ \Omega$ (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|--|---|--|------|-----------------------|---------------|

| | | XSMT = 2 V, no load, $PV_{CC} = 24\text{ V}$ | | 32 | 50 | mA |
| $I_{CC(SD)}$ | PVCC Quiescent supply current in shutdown mode | XSMT = 0.8 V, no load, $PV_{CC} = 12\text{ V}$ | | 30 | | μA |
| | | XSMT = 0.8 V, no load, $PV_{CC} = 24\text{ V}$ | | 50 | 400 | μA |

6.8 Timing Requirements - I²C Bus Timing

| | | | MIN | MAX | UNIT |
|--------------|---|----------|---------------|-----|---------|
| t_{SCL} | SCL clock frequency | Standard | | 100 | kHz |
| | | Fast | | 400 | |
| t_{BUF} | Bus free time between a STOP and START condition | Standard | 4.7 | | μ s |
| | | Fast | 1.3 | | |
| t_{LOW} | Low period of the SCL clock | Standard | 4.7 | | μ s |
| | | Fast | 1.3 | | |
| t_{HI} | High period of the SCL clock | Standard | 4 | | μ s |
| | | Fast | 0.6 | | |
| t_{RS-SU} | Setup time for (repeated) START condition | Standard | 4.7 | | μ s |
| | | Fast | 0.6 | | |
| t_{S-HD} | Hold time for (repeated) START condition | Standard | 4 | | μ s |
| | | Fast | 0.6 | | |
| t_{D-SU} | Data setup time | Standard | 0.25 | | μ s |
| | | Fast | 0.1 | | |
| t_{D-HD} | Data hold time | Standard | 0 | 0.9 | μ s |
| | | Fast | 0 | 0.9 | |
| t_{SCL-R} | Rise time of SCL signal | Standard | $20 + 0.1C_B$ | 1 | μ s |
| | | Fast | $20 + 0.1C_B$ | 0.3 | |
| t_{SCL-R1} | Rise time of SCL signal after a repeated START condition and after an acknowledge bit | Standard | $20 + 0.1C_B$ | 1 | μ s |
| | | Fast | $20 + 0.1C_B$ | 0.3 | |
| t_{SCL-F} | Fall time of SCL signal | Standard | $20 + 0.1C_B$ | 1 | μ s |
| | | Fast | $20 + 0.1C_B$ | 0.3 | |
| t_{SDA-R} | Rise time of SDA signal | Standard | $20 + 0.1C_B$ | 1 | μ s |
| | | Fast | $20 + 0.1C_B$ | 0.3 | |
| t_{SDA-F} | Fall time of SDA signal | Standard | $20 + 0.1C_B$ | 1 | μ s |
| | | Fast | $20 + 0.1C_B$ | 0.3 | |
| t_{P-SU} | Setup time for STOP condition | Standard | 4 | | μ s |
| | | Fast | 0.6 | | |
| C_B | Capacitive load for SDA and SCL line | | | 400 | pF |
| t_{SP} | Pulse width of spike suppressed | Fast | | 50 | ns |
| V_{NH} | Noise margin at high level for each connected device (including hysteresis) | | $0.2 V_{DD}$ | | V |

7 Detailed Description

7.1 Overview

The TAS576xM PurePath Smart Amp enhance the bass, sound fidelity and increased loudness by driving the speaker to its thermal and mechanical limits.

The TAS576xM contains two BTL class-D amplifiers that supply up to 2 x 50W peak power into 4 Ω . The amplifier is thermally designed to match the typical speaker so it can withstand high peaks for the time it takes the speaker voice-coil to heat up; it then lowers the average power to safe operating limits.

The wide supply range of 4.5 V to 26.4 V enables the use of different power supply options from 2-cell Li-Ion batteries to fixed 24-V supply.

The Smart Amp is available with two different class-D amplifier modulations: BD-mode in the TAS5766M; and, 1SPW-mode in the TAS5768M.

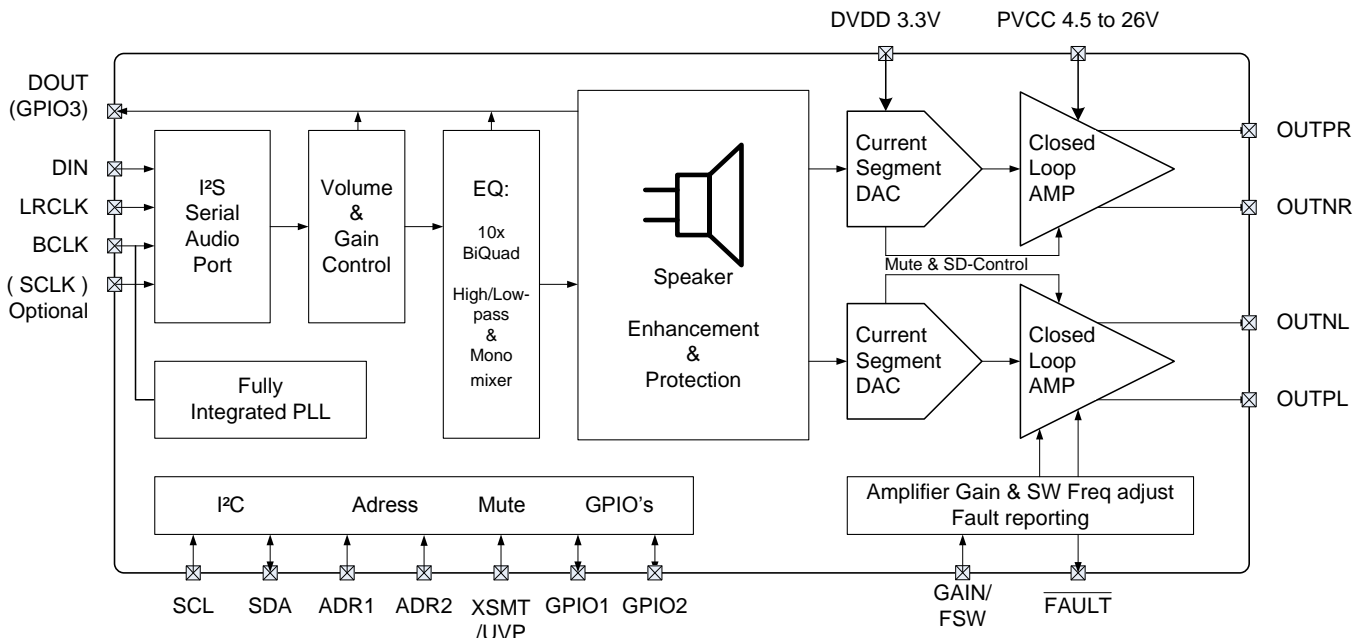

TI's PurePath Smart Amp technology allows speakers to be driven with more peak power than their average-power rating, without damage to the speaker by voice coil over excursion or thermal overload.

Sophisticated speaker models (electro-mechanical-thermal) are used as a foundation for the protection and enhancement of the system. This is done by modeling the loudspeaker in the on-chip miniDSP and running an adaptive algorithm that modifies the output based on the modeled conditions of the speaker.

TI provides a PurePath Console (PPC) GUI, including a TI learning board that measures the loudspeaker parameters. The PPC GUI generates the code for download to the device on boot-up.

Smart Amp technology in the TAS576xM uses information from the SOA (Safe Operating Area) characterization details for the loudspeaker, as well as real-world temperature, and uses this data in an adaptive control algorithm in order to control Smart Bass and Smart DRP (Dynamic Range Preservation). The protection side of the algorithm is also used for thermal protection and mechanical voice coil excursion protection.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Smart SOA

The "Safe Operating Area" (SOA) for a loudspeaker is based on its electro-mechanical-thermal model. Depending on a speaker's inefficiency, some of the power is dissipated as heat rather than mechanical/acoustic energy. By understanding the characteristics of the speaker, Smart Amp is able to drive the speaker harder, without causing the speaker to thermally overload; or, suffer voice coil over-exclusion and fail. SMART SOA are parameters that are differentiated by a PPC GUI into coefficients that the algorithm uses.

7.3.2 Smart BASS

Smart Bass is an intelligent True Bass Alignment algorithm. Smart Bass uses the combination of the speaker model and a desired target response selected by the user to equalize the speaker in the bass region. This target response is critical for the sound character and the user can apply the same target response to very different speakers and get the same sound.

In conventional adaptive Bass Boost Algorithms, designers need to vary the amount of bass boost whenever the output volume is changed. This approach is very much an "open loop" process. Smart Bass is a new proprietary algorithm that combines: True bass extension (in bandwidth and amplitude) and Psycho-acoustic bass extension, with a smart adaptive control.

Smart Bass varies the mix of True Bass extension and Psycho-acoustic bass extension in real time, depending on the loudspeakers position in its SOA.

Smart Bass dynamically switches between True Bass and Psycho-acoustic extension based on a number of parameters such as:

- Capabilities and properties of the speaker, including Q compensation
- Music type
- Volume setting
- Temperature
- User preferences
- Designer preferences

7.3.3 Smart Protection

The two main failure mechanisms for loudspeakers are over temperature and over excursion. By modeling the current state of the speaker, Smart Protection adaptively changes various settings in Smart Amplifier to avoid over temperature and over excursion. Design engineers must first provide details of the loudspeaker (driver and enclosure) into the GUI. From there the appropriate coefficients are generated for the algorithm.

7.3.4 Implementing a Real World Design

Traditionally, system developers and hardware engineers use graphic equalizers in trial-and-error fashion to boost the bass for each new speaker until the sound is right (or "good enough" in many cases). However, this typically results in a strange combined response with too much phase shift. This process must be repeated every time a new speaker is selected. The Smart Bass concept uses the GUI to select a desired target response takes the speaker out of the equation. By this approach users can obtain a target response with minimum phase warp and time domain ringing which gives a speedy and tight bass. Conversely, users can select a target response that has lots of ringing to give a classical heavy 'oomph' bass.

Feature Description (continued)

7.3.5 Modulation Schemes

7.3.5.1 BD-Modulation

The TAS5766M uses this modulation, it is a modulation scheme that allows operation without the classic LC reconstruction filter when the amp is driving an inductive load with short speaker wires. Each output is switching from 0 volts to the supply voltage. The OUTPx and OUTNx are in phase with each other with no input so that there is little or no current in the speaker. The duty cycle of OUTPx is greater than 50% and OUTNx is less than 50% for positive output voltages. The duty cycle of OUTPx is less than 50% and OUTNx is greater than 50% for negative output voltages. The voltage across the load sits at 0 V throughout most of the switching period, reducing the switching current, which reduces any I^2R losses in the load.

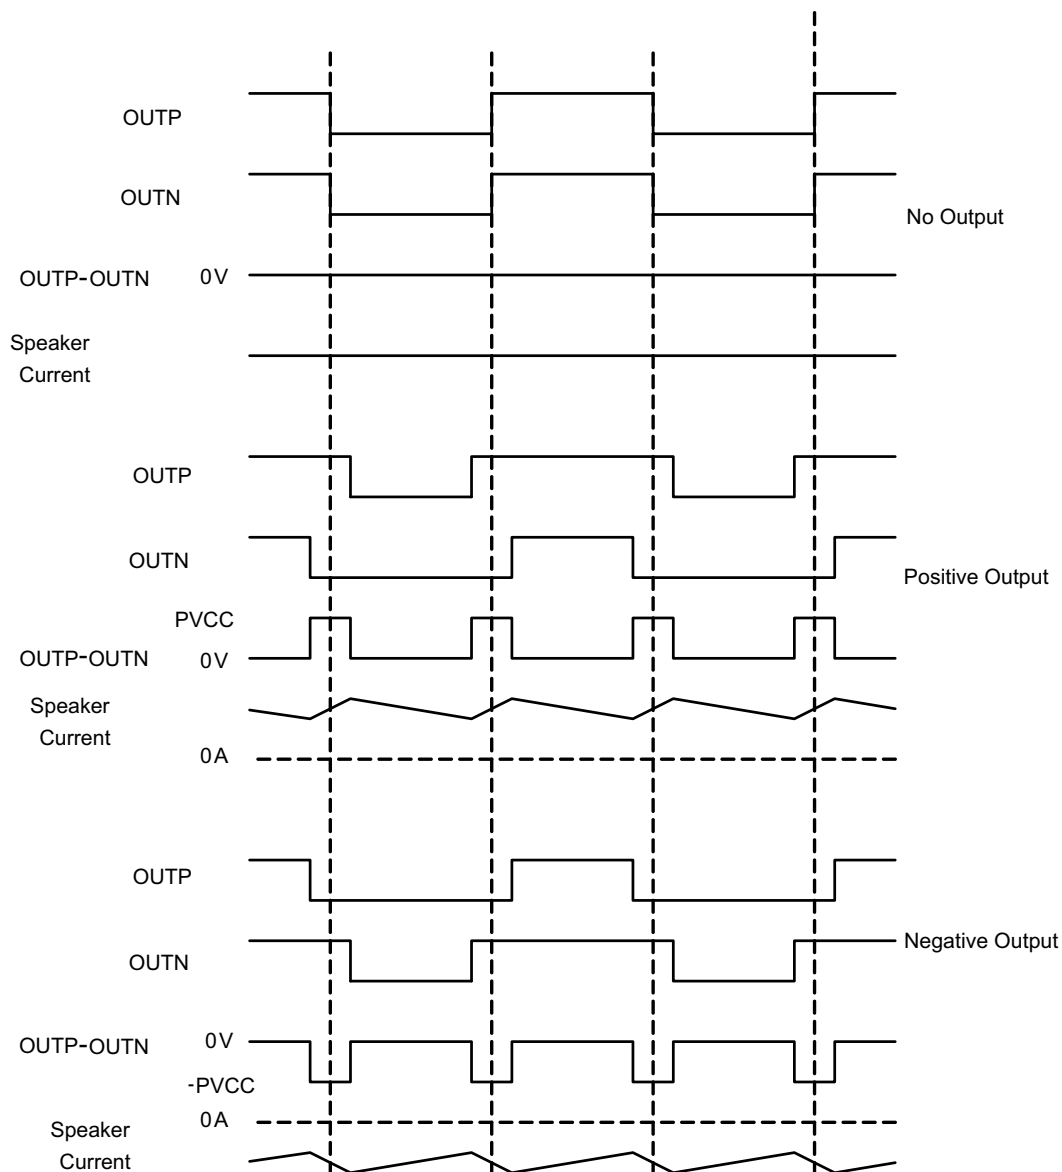

Figure 30. BD-Modulation

Feature Description (continued)

7.3.5.2 1SPW-Modulation

The TAS5768M uses this modulation, the 1SPW mode alters the normal modulation scheme in order to achieve higher efficiency with a slight penalty in THD degradation and more attention required in the output filter selection. In 1SPW mode the outputs operate at ~15% modulation during idle conditions. When an audio signal is applied one output will decrease and one will increase. The decreasing output signal will quickly rail to GND at which point all the audio modulation takes place through the rising output. The result is that only one output is switching during a majority of the audio cycle. Efficiency is improved in this mode due to the reduction of switching losses. The THD penalty in 1SPW mode is minimized by the high performance feedback loop. The resulting audio signal at each half output has a discontinuity each time the output rails to GND. This can cause ringing in the audio reconstruction filter unless care is taken in the selection of the filter components and type of filter used.

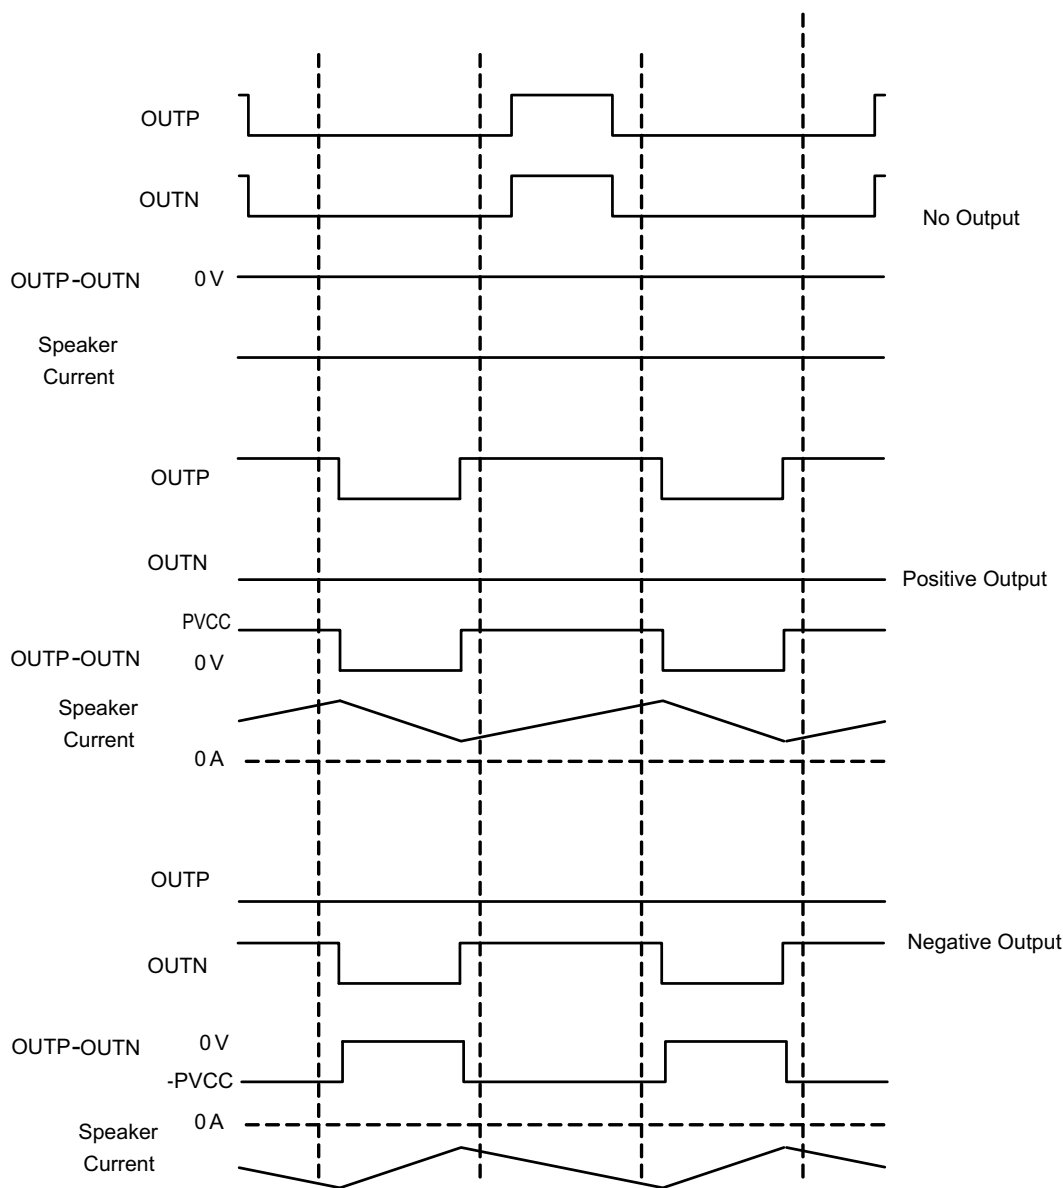

Figure 31. 1SPW-Modulation

7.4 Device Functional Modes

7.4.1 Device Protection System

The TAS576xM contains a complete set of protection circuits carefully designed to make system design efficient as well as to protect the device against any kind of permanent failures due to short circuits, overload, over temperature, and under-voltage. If an error is detected, the $\overline{\text{FAULT}}$ pin signals according to [Table 1](#).

Table 1. TAS576xM Device Protections

| FAULT | TRIGGERING CONDITION (TYPICAL VALUE) | $\overline{\text{FAULT}}$ | ACTION | LATCHED/SELF-CLEARING |
|-----------------------|--------------------------------------|---------------------------|-----------------------|-----------------------|
| Over Current | Output short or short to PVCC or GND | Low | Output high impedance | Self-clearing |
| Over Temperature | $T_J > 150^\circ\text{C}$ | Low | Output high impedance | Self-clearing |
| Too High DC offset | DC output voltage | Low | Output high impedance | Self-clearing |
| Under Voltage on PVCC | $\text{PVCC} < 4.5\text{ V}$ | High | Output high impedance | Self-clearing |
| Over voltage on PVCC | $\text{PVCC} > 27\text{ V}$ | High | Output high impedance | Self-clearing |

7.4.1.1 Over Current Protection

The TAS576xM has protection from over current conditions caused by a short circuit or over load on the output stage. The fault is reported on the $\overline{\text{FAULT}}$ pin as a low state. The amplifier outputs are switched to a high impedance state when the over current is detected. The outputs are automatically re-engaged after a 1.3s off time.

7.4.1.2 Thermal Protection

Thermal protection on the TAS576xM prevents damage to the device when the internal die temperature exceeds 150°C . There is a 15°C hysteresis on this trip point. When the die temperature exceeds the thermal trip point, the device enters into the shutdown state and the outputs are put in high impedance mode. The outputs are automatically re-engaged after a 1.3s off time if the temperature is below the trip point.

7.4.1.3 DC Protection

DC protection on the TAS576xM prevents damage to the attached speaker when the output DC voltage exceeds 20% of supply voltage. When the voltage exceeds the trip point, the device enters into the shutdown state and the outputs are put in high impedance mode. The outputs are automatically re-engaged after a 0.65 s off time if the voltage is below the trip point.

7.4.2 Reset and System Clock Functions

7.4.2.1 Power-On Reset Function

The TAS576xM includes a power-on reset function shown in [Figure 32](#). With $\text{DVDD} > 2.8\text{ V}$, the power-on reset function is enabled. After the initialization period, the TAS576xM is set to its default reset state.

Figure 32. Power-On Reset Timing, DVDD = 3.3V

7.4.2.2 System Clock Input

The TAS576xM requires a system clock to operate the digital interpolation filters and advanced segment DAC modulators. The system clock is applied at the SCLK input (pin 12) and supports up to 50MHz. The TAS576xM system-clock detection circuit automatically senses the system-clock frequency. The Smart AMP processing block only supports 44.1 kHz and 48kHz sampling rates even though the hardware supports all the common audio sampling frequencies in the bands of 8 kHz, 16 kHz, (32 kHz–44.1 kHz–48kHz), (88.2 kHz–96 kHz), (176.4 kHz–192 kHz), and 384 kHz with $\pm 4\%$ tolerance.

Values in the parentheses are "grouped" when detected, e.g. 88.2 kHz and 96 kHz are detected as "double rate", 32 kHz, 44.1 kHz and 48 kHz will be detected as "single rate". The sampling frequency detector sets the clock for the digital filter, Delta Sigma Modulator (DSM) and the Negative Charge Pump (NCP) automatically. [Table 2](#) shows examples of system clock frequencies for common audio sampling rates.

SCLK rates that are not common to standard audio clocks, between 1 MHz and 50 MHz, are only supported in software mode by configuring various PLL and clock-divider registers. This programmability allows the device to become a clock master and drive the host serial port with LRCLK and BCLK, from a non-audio related clock (for example, using 12 MHz to generate 44.1 kHz (LRCLK) and 2.8224 MHz (BCLK))

[Figure 33](#) shows the timing requirements for the system clock input. For optimal performance, use a clock source with low phase jitter and noise.

Table 2. System Master Clock Inputs for Audio Related Clocks

| SAMPLING FREQUENCY | SYSTEM CLOCK FREQUENCY (f_{SCLK}) (MHz) | | | | | | |
|--------------------|---|-----------|-----------|-----------|-----------|-----------|------------|
| | 128 f_s | 192 f_s | 256 f_s | 384 f_s | 512 f_s | 768 f_s | 1024 f_s |
| 44.1 kHz | 5.6488 | 8.4672 | 11.2896 | 16.9344 | 22.5792 | 33.8688 | 45.1584 |
| 48 kHz | 6.1440 | 9.2160 | 12.2880 | 18.4320 | 24.5760 | 36.8640 | 49.1520 |

Figure 33. Timing Requirement for SCLK Input

Table 3. Timing Requirements for SCLK Input

| | MIN | MAX | UNIT |
|--|-----|------|------|
| t_{SCY} System clock pulse cycle time | 20 | 1000 | ns |
| t_{SCLKH} System clock pulse width, High | 8 | | ns |
| t_{SCLKL} System clock pulse width, Low | 9 | | ns |

7.4.3 System Clock PLL Mode

The system clock PLL mode allows designers to use a simple 3-wire I²S audio source when driving the output. The 3-wire source reduces the need for a high frequency SCLK, making PCB layout easier, and reduces high frequency electromagnetic interference.

The user must set all the PLL registers and clock divider registers for referencing BCLK. See [Clock Generation and PLL](#) for more information.

Table 4. BCLK Rates (MHz) by LRCLK Sample Rate for PLL Operation

| Sample f (kHz) | BCLK (f _s) | |
|----------------|------------------------|--------|
| | 32 | 64 |
| 44.1 | 1.4112 | 2.8224 |
| 48 | 1.536 | 3.072 |

7.4.4 Clock Generation and PLL

The TAS576xM supports a wide range of options to generate the required clocks for the DAC section as well as interface and other control blocks as shown in [Figure 34](#).

The clocks for the PLL require a source reference clock. This clock is sourced as the incoming BCLK or SCLK. The source reference clock for the PLL reference clock is selected by programming the SRCREF value on Page 0, Register 13, D(6:4). The PLL reference clock can then be routed through highly-flexible clock dividers shown in [Table 5](#) to generate the various clocks required for the DAC, Negative Charge Pump (NCP), Internal modulator and sections. The TAS576xM provides several programmable clock dividers to achieve a variety of sampling rates for the DAC and clocks for the NCP, OSR, and the OSRCK for OSR must be set at 16f_S frequency by DOSR on Page0, Register 30, D(6:0).

If PLL functionality isn't required, set the PLEN value on Page 0, Register 4, D(0) to 0. In this situation, an external SCLK is required.

Table 5. PLL Configuration Registers

| CLOCK MULTIPLEXER | FUNCTION | BITS |
|-------------------|--------------------|-----------------------------|

Figure 34. PLL Clock Source and Clock Distribution

7.4.5 PLL Calculation

The TAS576xM has an on-chip PLL with fractional multiplication to generate the clock frequency needed by the audio DAC, Negative Charge Pump, Modulator and Digital Signal Processing blocks. The programmability of the PLL allows operation from a wide variety of clocks that may be available in the system. The PLL input (PLLCKIN) supports clock frequencies from 512 kHz to 50 MHz and is register programmable to enable generation of required sampling rates with fine precision.

The PLL is enabled by default. The PLL can be turned on by writing to Page 0, Register 4, D(0). When the PLL is enabled, the PLL output clock PLLCK is given by [Equation 1](#):

$$\text{PLLCK} = \frac{\text{PLLCKIN} \times R \times J.D}{P} \quad \text{or} \quad \text{PLLCK} = \frac{\text{PLLCKIN} \times R \times K}{P} \quad (1)$$

R = 1, 2, 3, 4, ... 15, 16

J = 0 4, 5, 6, ... 63 and D = 0000, 0001, 0002, ... 9999

K = [J value].[D value]

P = 0 1, 2, 3, ... 15

R, J, D and P are programmable. J is the integer portion of K (the number to the left of the decimal point) while D is the fraction portion of K (the number to the right of the decimal point, assuming four digits of precision).

Examples:

- If K = 8.5, then J = 8, D = 5000
- If K = 7.12, then J = 7, D = 1200
- If K = 14.03, then J = 14, D = 0300

- If $K = 6.0004$, then $J = 6$, $D = 0004$

When the PLL is enabled and $D = 0000$, the following conditions must be satisfied:

- $1 \text{ MHz} \leq (\text{PLLCKIN} / P) \leq 20 \text{ MHz}$
- $64 \text{ MHz} \leq (\text{PLLCKIN} \times K \times R / P) \leq 100 \text{ MHz}$
- $1 \leq J \leq 63$

When the PLL is enabled and $D \neq 0000$, the following conditions must be satisfied:

- $6.667 \text{ MHz} \leq \text{PLLCLKIN} / P \leq 20 \text{ MHz}$
- $64 \text{ MHz} \leq (\text{PLLCKIN} \times K \times R / P) \leq 100 \text{ MHz}$
- $4 \leq J \leq 11$
- $R = 1$

When the PLL is enabled:

- $f_S = (\text{PLLCLKIN} \times K \times R) / (2048 \times P)$
- The value of N is selected so that $f_S \times N = \text{PLLCLKIN} \times K \times R / P$ is in the allowable range.

Example: $\text{MCLK} = 12 \text{ MHz}$ and $f_S = 44.1 \text{ kHz}$, ($N=2048$)

Select $P = 1$, $R = 1$, $K = 7.5264$, which results in $J = 7$, $D = 5264$

Example: $\text{MCLK} = 12 \text{ MHz}$ and $f_S = 48.0 \text{ kHz}$, ($N=2048$)

Select $P = 1$, $R = 1$, $K = 8.192$, which results in $J = 8$, $D = 1920$

Values are written to the registers in [Table 6](#).

Table 6. PLL Registers

| DIVIDER | FUNCTION | BITS |
|---------|------------|-----------------------------|
| PLLE | PLL enable | Page 0, Register 4, D(0) |

Table 7. PLL Configuration Recommendations

| COLUMN | DESCRIPTION |
|------------------|--|
| f_S (kHz) | Sampling frequency |
| RSCLK | Ration between sampling frequency and SCLK frequency ($\text{SCLK frequency} = \text{RSCLK} \times \text{sampling frequency}$) |
| SCLK (MHz) | System master clock frequency at SCLK input (pin 22) |
| PLL VCO (MHz) | PLL VCO frequency as PLLCK |
| P | One of the PLL coefficients |
| PLL REF (MHz) | Internal reference clock frequency which is produced by SCLK / P |
| $M = K \times R$ | The final PLL multiplication factor computed from K and R as described in Equation 1 |
| $K = J.D$ | One of the PLL coefficients |
| R | One of the PLL coefficients |
| PLL f_S | Ratio between f_S and PLL VCO frequency ($\text{PLL VCO} / f_S$) |
| DSP f_S | Ratio between operating clock rate and f_S ($\text{PLL } f_S / \text{NMAC}$) |
| NMAC | The clock divider value in Table 4 |
| DSP CLK (MHz) | The operating frequency as DSPCK in Clock Generation and PLL |
| MOD f_S | Ratio between DAC operating clock frequency and f_S ($\text{PLL } f_S / \text{NDAC}$) |
| MOD f (kHz) | DAC operating frequency as DACCK in Clock Generation and PLL |
| NDAC | DAC clock divider value in Table 4 |
| DOSR | OSR clock divider value in Table DOSR 7 for generating OSRCK in Clock Generation and PLL . DOSR must be chosen so that $\text{MOD } f_S / \text{DOSR} = 16$ for correct operation. |

Table 7. PLL Configuration Recommendations (continued)

| COLUMN | DESCRIPTION |
|---------|---|
| NCP | NCP (negative charge pump) clock divider value in Table 4 |
| CP f | Negative charge pump clock frequency (fS × MOD fS / NCP) |
| % Error | Percentage of error between PLL VCO / PLL fS and fS (mismatch error). <ul style="list-style-type: none"> This number is typically zero but can be non-zero especially when K is not an integer (D is % Error not zero). This number may be non-zero only when the TAS576xM acts as a master |

7.4.6 Audio Data Interface

7.4.6.1 Audio Serial Interface

The audio interface port is a 3-wire serial port with the signals LRCLK (pin 15), BCLK (pin 13), and DIN (pin 14). BCLK is the serial audio bit clock, used to clock the serial data present on DIN into the serial shift register of the audio interface. Serial data is clocked into the TAS576xM on the rising edge of BCLK. LRCLK is the serial audio left/right word clock.

Table 9. TAS576xM Audio Data Formats, Bit Depths and Clock rates

| FORMAT | DATA BITS | LRCLK | SCH RATE | BCLK RATE |
|---------------------|----------------|----------------|----------|------------|
| I ² S/LJ | 32, 24, 20, 16 | 44.1 or 48 kHz | 128–3072 | 64, 48, 32 |
| TDM | 32, 24, 20, 16 | 44.1 or 48 kHz | 128–3072 | 128, 265 |

The TAS576xM requires the synchronization of LRCLK and system clock, but does not require a specific phase relation between LRCLK and system clock.

If the relationship between LRCLK and system clock changes more than ± 5 SCLK, internal operation is initialized within one sample period and analog outputs are forced to the bipolar zero level until resynchronization between LRCLK and system clock is completed.

7.4.6.2 PCM Audio Data Formats and Timing

The TAS576xM supports industry-standard audio data formats, including standard I2S and left-justified. Data formats are selected via Register (Pg0Reg40). All formats require binary 2s-complement, MSB-first audio data, up to 32-bit audio data is accepted.

The TAS576xM also supports right-justified and TDM. I2S, LJ, RJ, and TDM are selected using Register (Pg0Reg40). All formats require binary 2s complement, MSB-first audio data. Up to 32 bits are accepted. Default setting is I2S and 24 bit word length. The I2S slave timing is shown in Figure 35.

Figure 35. TAS576xM Serial Audio Timing – Slave

Table 10. Audio Interface Slave Timing

| | | MIN | MAX | UNIT |
|------------|--|-----|--------|------|
| t_{BCY} | BCLK pulse Cycle Time | 40 | | ns |
| t_{BCL} | BCLK pulse Width LOW | 16 | | ns |
| t_{BCH} | BCLK pulse Width HIGH | 16 | | ns |
| t_{BL} | BCLK Rising Edge to LRCLK Edge | 8 | | ns |
| t_{BCLK} | BCLK frequency at DVDD = 3.3V | | 24.576 | MHz |
| t_{LB} | LRCLK Edge to BCLK Rising Edge | 8 | | ns |
| t_{DS} | DATA set Up time | 8 | | ns |
| t_{DH} | DATA Hold Time | 8 | | ns |
| t_{DOD} | DATA delay time from BCLK falling edge | | 15 | ns |

The TAS576xM can act as an I²S master, generating BCLK and LRCLK as outputs from the SCLK input.

Table 11. I²S Master Mode Registers

| REGISTER | FUNCTION |
|---|-------------------------------------|
| Page 0, register 9, D(0), D(4) and D85) | I ² S master Mode select |
| Register 32, D(6:0) | BCLK divider and LRCLK divider |
| Register 33, D(7:0) | |

The I²S master timing is shown in Figure 36 and Table 12.

Figure 36. TAS576xM Serial Audio Timing - Master

Table 12. Audio Interface Master Timing

| | | MIN | MAX | UNIT |
|------------|--|-----|--------|------|
| t_{BCY} | BCLK pulse Cycle Time | 40 | | ns |
| t_{BCL} | BCLK pulse Width LOW | 16 | | ns |
| t_{BCH} | BCLK pulse Width HIGH | 16 | | ns |
| t_{BL} | BCLK Rising Edge to LRCLK Edge | 8 | | ns |
| t_{BCLK} | BCLK frequency at DVDD = 3.3V | | 24.576 | MHz |
| t_{LB} | LRCLK Edge to BCLK Rising Edge | 8 | | ns |
| t_{DS} | DATA set Up time | 8 | | ns |
| t_{DH} | DATA Hold Time | 8 | | ns |
| t_{DOD} | DATA delay time from BCLK falling edge | | 15 | ns |

7.4.7 TAS576xM Audio Processing Options

7.4.7.1 Overview

The TAS576xM features a configurable miniDSP core. The algorithms for the miniDSP are loaded into the device after power up. The miniDSP has direct access to the digital stereo audio stream, offering the possibility for advanced DSP algorithms with very low group delay. The miniDSP can run up to 1024 instructions on every audio sample at a 48 kHz sample rate.

The TAS576xM Smart Amplifier uses a mix of code sources. ROM based process flow and RAM based process flow. In the program, different algorithms are called from ROM – such as EQ, DRC and Zero Crossing volume control enabling a faster program load.

7.4.7.2 miniDSP Instruction Register

Registers on Register Pages 152-169 are 25-bit instructions for the miniDSP engine. For details, see [Table 21](#). Seven (7) bits of Instr(32:25) in Base register +0 are reserved bits. 1 bit of Instr(24) – (LSB) in Base register +0 is MSB bit of 25-bit instruction. These instructions control miniDSP operation. When the fully programmable miniDSP mode is enabled and the DAC channel is powered up, the read and write access to these registers is disabled.

7.4.7.3 Digital Output

The TAS576xM supports an SDOOUT output. This can be selected within the process flow, and driven out of a GPIO pin selected in the register map (e.g. Page 0 / Register 80). The I2S output can be fed back to the signal host and used for echo cancellation.

7.4.7.4 Software

Software selection for the TAS576xM is supported through TI's comprehensive PurePath Console Development Environment; a powerful, easy-to-use tool designed specifically to simplify development on the TAS576xM platform. Visit the TAS576xM product folder on www.ti.com to learn more about PurePath Console and the latest status on available, ready-to-use DSP algorithms.

7.4.7.5 Process Flow

An example of the default Process Flow available for the TAS576xM in the PurePath Console target is shown below:

Figure 43. Example Process Flow

This process flow has from input to output:

- Volume block, from -110 db to +6 dB with 0.5 dB steps, including a fixed gain block of 0dB to 12 dB gain
- monobass mixer – mixes the bass into mono below the set frequency, useful for systems where left and right speaker shares the same cabinet volume, bypassed when not needed.
- 10 Biquads for filtering and EQ. The PPC GUI have an advanced biquad control where various filter and eq options can be set and controlled.
- SmartAmp block, containing all the blocks for bass Q compensation, bass alignment, excursion control and power limited
- Digital monitor output enabled on GPIO3

7.4.7.6 Zero Data Detect

The TAS576xM has a zero-detect function. When the device detects the continuous zero data for both L-ch and R-cn, or separate L-cn and R-ch, Analog mutes are set to both OUTL and OUTR, or separate OUTL and OUTR. These are controlled by Page0, Register 65, D(2:1) as shown in [Table 13](#).

Continuous Zero data cycles are counted by LRCLK, and the threshold of decision for analog mute can be set by Page 0, Register 59, D(6:4) for L-ch, and D(2:0) for Rch as shown in [Table 14](#). Default values are 0 for both channels.

Table 13. Zero Detection Mode

| ATMUTECTL | VALUE | FUNCTION |
|-----------|-------------|---|
| Bit:2 | 0 | Independently L-ch or R-ch are zero data for zero detection |
| | 1 (Default) | Both L-ch and R-ch have to be zero data for zero detection |
| Bit:1 | 0 | Zero detection and analog mute are disabled for R-ch |
| | 1 (Default) | Zero detection and analog mute are enabled for R-ch |
| Bit:0 | 0 | Zero detection and analog mute are disabled for L-ch |
| | 1 (Default) | Zero detection and analog mute are enabled for L-ch |

Table 14. Zero Data Detection Time

| ATMUTETIML / ATMUTETIMR | NUMBER of LRCLKs | TIME at 48 kHz |
|-------------------------|------------------|----------------|
| 0 0 0 | 1024 | 21 ms |
| 0 0 1 | 5120 | 106 ms |
| 0 1 0 | 10240 | 213 ms |
| 0 1 1 | 25600 | 533 ms |
| 1 0 0 | 51200 | 1.07 sec |
| 1 0 1 | 102400 | 2.13 sec |
| 1 1 0 | 256000 | 5.33 sec |
| 1 1 1 | 512000 | 10.66 sec |

7.4.7.7 Power Save Modes

The TAS576xM offers two power-save modes; standby and power-down.

When a clock error (SCLK, BCLK, and LRCLK) or clock halt is detected, the TAS576xM automatically enters standby mode. The DAC and power amplifier are also powered down. The device can also be placed in standby mode via software command.

When BCLK and LRCLK remain at a low level for more than 1 second, the TAS576xM automatically enters power-down mode. Power-down mode disables the negative charge pump and bias/reference circuit, in addition to those disabled in standby mode. The device can also be placed in power-down mode via I²C command.

When expected Audio clocks (SCLK, BCLK, LRCLK) are applied to the TAS576xM, the device starts its power-up sequence automatically.

Table 15. Power Save Parameter Programming

| REGISTER | DESCRIPTION |
|-----------------------------------|--|
| Page 0, register 2, D(4) | I ² C standby-mode command |
| Page 0, register 2, D(0) | I ² C power-down command |
| Page 0, register 2, D(4) and D(0) | I ² C power-up sequence command (required after I ² C standby or power-down command) |
| Page 0, register 44, D(2:0) | Detection time of BCLK and LRCLK halt |

7.4.7.8 XSMT Pin (Soft Mute/Soft Un-Mute)

An external digital host controls the TAS576xM soft mute function by driving the XSMT pin with a specific minimum rise time (t_r) and fall time (t_f) for soft mute and soft un-mute. The TAS576xM requires t_r and t_f times of less than 20ns. In the majority of applications, this is no problem, however, traces with high capacitance may have issues.

When the XSMT pin is shifted from high to low (3.3V to 0V), a soft digital attenuation ramp begins. –1dB attenuation is then applied every sample time from 0dBFS to –104dBFS.

When the XSMT pin is shifted from low to high (0V to 3.3V), a soft digital “un-mute” is started. 1dB gain steps are applied every sample time from –104dBFS to 0dBFS.

Figure 44. XSMT Timing for Soft Mute and Soft Un-Mute

7.4.7.9 External Power Sense Undervoltage Protection Mode

The XSMT pin can also be used to monitor a system voltage, such as the 24-VDC LCD TV back light, or 12-VDC system supply using a voltage divider created with two resistors. See [Figure 45](#).

- * If the XSMT pin makes a transition from “1” to “0” over 6ms or more, the device switches into external undervoltage protection mode. This mode uses two trigger levels.
- * When the XSMT pin level reaches 2 V, soft mute process begins.
- * When the XSMT pin level reaches 1.2 V, analog mute engages, regardless of digital audio level, and analog shutdown begins. (DAC and related circuitry powers down).

Figure 45. External Power Sense

A timing diagram describing this is shown in [Figure 46](#).

NOTE

The XSMT input pin voltage range is from -0.3 V to $\text{DVDD} + 0.3\text{ V}$. The ratio of external resistors must produce a voltage within this input range. Any increase in power supply (such as power supply positive noise or ripple) can pull the XSMT pin higher than $\text{DVDD} + 0.3\text{ V}$.

For example, if the TAS576xM is monitoring a 12 V input, and dividing the voltage by 4, then the voltage at XSMT during ideal power supply conditions is 3 V. A voltage spike higher than 14.4 V causes a voltage greater than 3.6 V ($\text{DVDD} + 0.3$) on the XSMT pin, potentially damaging the device. Providing the divider is set appropriately, any DC voltage can be monitored.

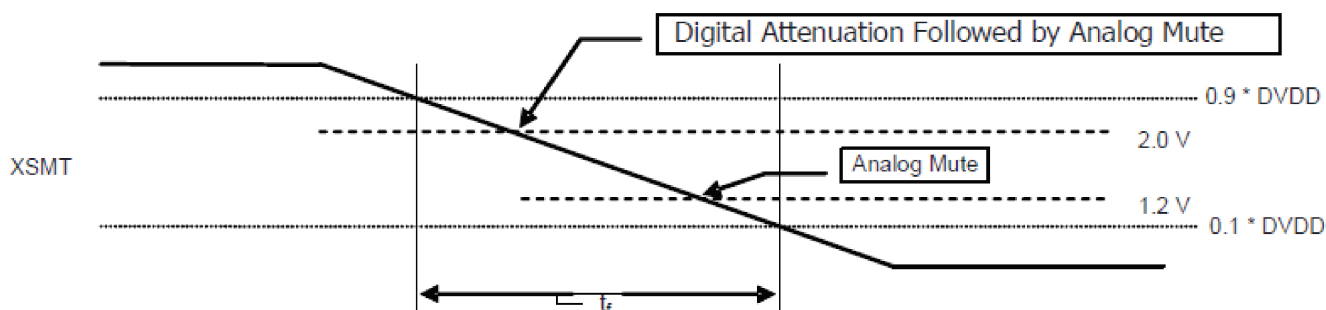

Figure 46. XSMT Timing for Undervoltage Protection

7.4.7.10 Recommended Power Down Sequence

With inadequate system design, the TAS576xM can exhibit pop on power down. Pops are caused by the device not having enough time to detect power loss and start the muting process.

The TAS576xM evaluation board avoids audible pop with an electrolytic decoupling capacitor. This capacitor provides enough time between data loss from USB or S/PDIF and power supply loss for the muting process to take place.

The TAS576xM has two auto-mute functions to mute the device upon power loss (intentional or unintentional).

7.4.7.10.1 XSMT = 0

When the XSMT pin is pulled low, the incoming PCM data is attenuated to 0, then closely followed by a hard analog mute. This process takes $150t_s + 0.2\text{ ms}$.

7.4.7.10.2 Clock Error Detect

When clock error is detected on the incoming data clock, the TAS576xM family switches to an internal oscillator, and continues to drive the output, while attenuating the data from the last known value. Once this process is complete, the TAS576xM outputs are pulled to ground with $30\text{ k}\Omega$.

7.4.7.10.3 Planned Shutdown

These auto-muting processes can be manipulated by system designs to mute before power loss in the following ways: Assert XSMT low $150t_s + 0.2\text{ ms}$ before power is removed, shown in [Figure 47](#).

Figure 47. Assert XSMT Low Example

Stop I²S clocks (SCLK, BCLK, LRCLK) 3ms before power down as shown in [Figure 48](#) below:

Figure 48. Stop I²S Clocks Example

7.5 Programming

7.5.1 I²C Interface and Slave Address

The TAS576xM supports the I²C serial bus and the data transmission protocol for standard and fast mode as a slave device.

Table 16. I²C pins and Functions

| SIGNAL | PIN | I/O | DESCRIPTION |
|--------|-----|-----|---------------|
| SDA | 16 | I/O | I2C data |
| SCL | 17 | I | I2C clock |
| ADR2 | 20 | I | I2C address 2 |
| ADR1 | 26 | I | I2C address 1 |

7.5.2 Slave Address

Table 17. I²C Slave Address

| Address | D7 | D6 | D5 | D4 | D3 | ADR2 | ADR1 | R/W |
|---------|----|----|----|----|----|------|------|-----|
| 0x98 | 1 | 0 | 0 | 1 | 1 | 0 | 0 | x |
| 0x9A | | | | | | 0 | 1 | |
| 0x9C | | | | | | 1 | 0 | |
| 0x9E | | | | | | 1 | 1 | |

The TAS576xM has 7 bits for its own slave address. The first five bits (MSBs) of the slave address are factory preset to 10011 (0x9x). The next two bits of the address byte are the device select bits which can be user defined by the ADR1 and ADR0 pins. A maximum of four TAS576xMs can be connected on the same bus at one time. This gives a range of 0x98, 0x9A, 0x9C and 0x9E. Each TAS576xM responds when it receives its own slave address.

7.5.3 Register Address Auto-Increment Mode

Auto-increment mode allows multiple sequential register locations to be written to or read back in a single operation, and is especially useful for block write and read operations.

Figure 49. Auto Increment Mode

7.5.4 Packet Protocol

A master device must control packet protocol, which consists of start condition, slave address, read/write bit, data if write or acknowledge if read, and stop condition. The TAS5766M supports only slave receivers and slave transmitters.

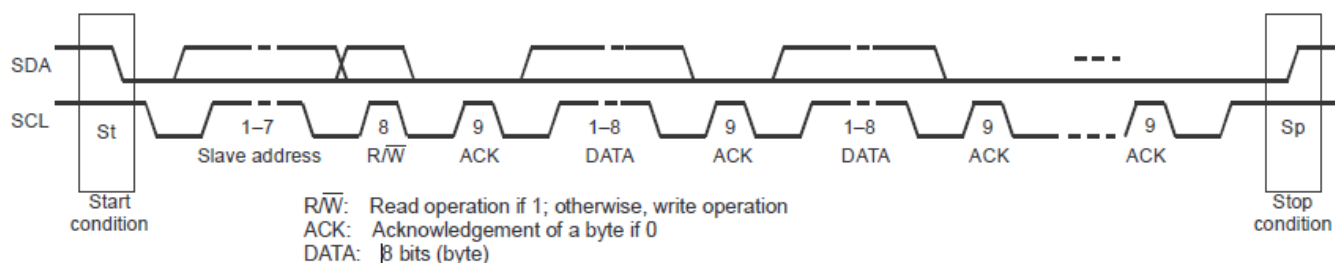

Figure 50. Packet Protocol

Table 18. Read / Write Operation – Basic I²C Framework

| Transmitter | M | M | M | S | M | S | M | S | | S | M |
|-------------|----|---------------|----|-----|------|-----|------|-----|--|------|----|
| Data Type | St | Slave address | W/ | ACK | DATA | ACK | DATA | ACK | | ACK | Sp |
| Transmitter | M | M | M | S | S | M | S | M | | M | S |
| Data Type | St | Slave address | R/ | ACK | DATA | ACK | DATA | ACK | | NACK | Sp |

M = Master Device; S = Slave Device; St = Start Condition; Sp = Stop Condition

7.5.5 Write Register

A master can write to any TAS576xM registers using single or multiple accesses. The master sends a TAS576xM slave address with a write bit, a register address with auto-increment bit, and the data. If auto-increment is enabled, the address is that of the starting register, followed by the data to be transferred. When the data is received properly, the index register is incremented by 1 automatically. When the index register reaches 0x7F, the next value is 0x0. The following table shows the write operation.

Table 19. Write Operation

| Transmitter | M | M | M | S | M | | S | M | S | M | S | | S | M |
|-------------|----|---------------|---|-----|-----|-------------|-----|----------------|-----|----------------|-----|--|-----|----|
| Data Type | St | Slave addr | W | ACK | inc | reg addr | ACK | Write data1 | ACK | Write data2 | ACK | | ACK | Sp |

M = Master Device; S = Slave Device; St = Start Condition; Sp = Stop Condition; W = Write; ACK = Acknowledge

7.5.5.1 Read Register

A master can read the TAS576xM register. The value of the register address is stored in an indirect index register in advance. The master sends a TAS576xM slave address with a read bit after storing the register address. Then the TAS576xM transfers the data which the index points to. When auto-increment is enabled, the index register is incremented by 1 automatically. When the index register reaches 0x7F, the next value is 0x0. The following table shows the read operation.

Table 20. Read Operation

| Transmitter | M | M | M | S | M | S | M | M | M | S | S | M | | M | M |
|-------------|----|------------|---|-----|-----|----------|-----|----|------------|---|-----|------|-----|------|----|
| Data Type | St | Slave addr | W | ACK | inc | reg addr | ACK | Sr | Slave addr | R | ACK | data | ACK | NACK | Sp |

M = Master Device; S = Slave Device; St = Start Condition; Sr = Repeated start condition; Sp = Stop Condition; W = Write; R 0 read; NACK = Acknowledge

7.6 Register Maps

In any page, register 0 is the Page Select Register. The register value selects the Register Page from 0 to 255 for next read or write command.

Table 21. Register Map Summary⁽¹⁾

| Register No | Description | Register No | Description |
|---------------|---|----------------|--|
| Page 0 | | 44 | Clock missing detection period |
| 0 | Page Select register | 59 | Auto mute time |

8 Applications and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

One of the most significant benefits of the TAS5766M device is the ability to be used in a variety of applications. This section details the information needed to configure the device for several popular configurations and provides guidance on integrating the TAS5766M device into the larger system.

8.1.1 External Component Selection Criteria

The Supporting Component Requirements table in each application description section lists the details of the supporting required components in each of the System Application Schematics.

Where possible, the supporting component requirements have been consolidated to minimize the number of unique components which are used in the design. Component list consolidation is a method to reduce the number of unique part numbers in a design, to ease inventory management, and reduce the manufacturing steps during board assembly. For this reason, some capacitors are specified at a higher voltage than what would normally be required. An example of this is a 50-V capacitor may be used for decoupling of a 3.3-V power supply net.

In this example, a higher voltage capacitor can be used even on the lower voltage net to consolidate all caps of that value into a single component type. Similarly, a several unique resistors, having all the same size and value but with different power ratings can be consolidated by using the highest rated power resistor for each instance of that resistor value.

While this consolidation may seem excessive, the benefits of having fewer components in the design may far outweigh the trivial cost of a higher voltage capacitor. If lower voltage capacitors are already available elsewhere in the design, they can be used instead of the higher voltage capacitors. In all situations, the voltage rating of the capacitors must be at least 1.45 times the voltage of the voltage which appears across them. The power rating of the capacitors should be 1.5 times to 1.75 times the power dissipated in it during normal use case.

8.1.2 Component Selection Impact on Board Layout, Component Placement, and Trace Routing

Because the layout is important to the overall performance of the circuit, the package size of the components shown in the component list were intentionally chosen to allow for proper board layout, component placement, and trace routing. In some cases, traces are passed in between two surface mount pads or ground plane extends from the TAS5766M device between two pads of a surface mount component and into to the surrounding copper for increased heat-sinking of the device. While components may be offered in smaller or larger package sizes, it is highly recommended that the package size remain identical to that used in the application circuit as shown. This consistency ensures that the layout and routing can be matched very closely, optimizing thermal, electromagnetic, and audio performance of the TAS5766M device in circuit in the final system.

8.1.3 Amplifier Output Filtering

The TAS5766M device is often used with a low-pass filter, which is used to filter out the carrier frequency of the PWM modulated output. This filter is frequently referred to as the L-C Filter, due to the presence of an inductive element L and a capacitive element C to make up the 2-pole filter.

Application Information (continued)

The L-C filter removes the carrier frequency, reducing electromagnetic emissions and smoothing the current waveform which is drawn from the power supply. The presence and size of the L-C filter is determined by several system level constraints. In some low-power use cases that do not have other circuits which are sensitive to EMI, a simple ferrite bead or ferrite bead and capacitor can replace the traditional large inductor and capacitor that are commonly used. In other high-power applications, large toroid inductors are required for maximum power and film capacitors may be preferred due to audio characteristics. Refer to the application report [SLOA119](#) for a detailed description on proper component selection and design of an L-C filter based upon the desired load and response.

8.2 Typical Applications

8.2.1 Stereo Application

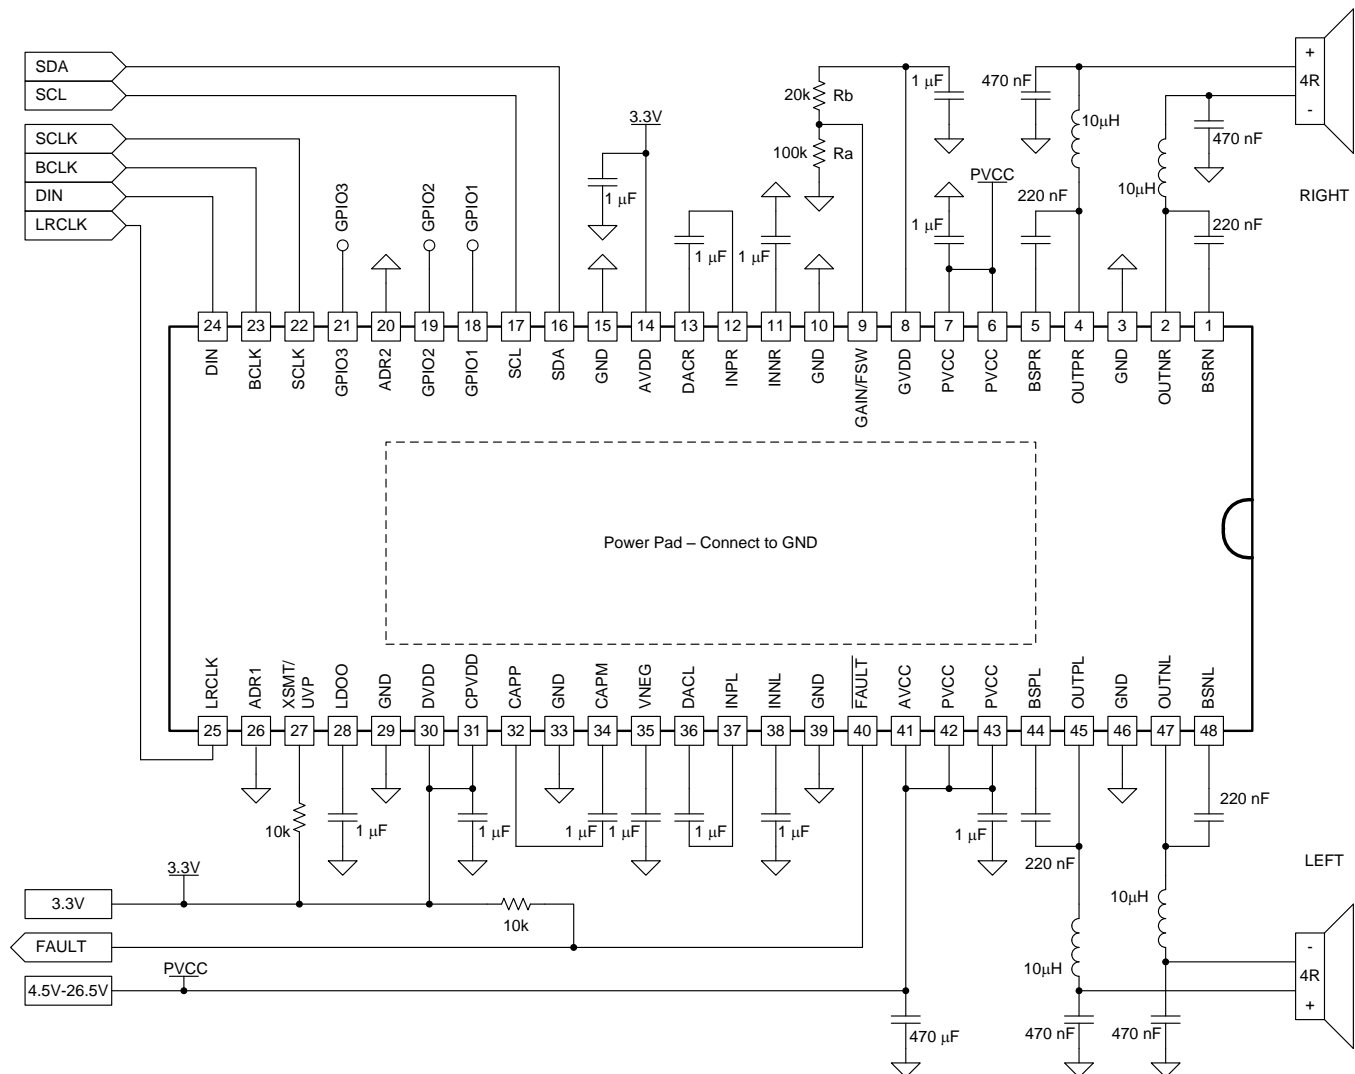

Figure 51. Typical Stereo Application

Typical Applications (continued)

8.2.1.1 Design Requirements

The device is configured to have 20 dB analog gain and switch at 768kHz, by the resistor network on the GAIN/FSW pin 9.

I²C slave address is set to default 0x98, as a result of the two address pins (ADR1, pin 26 and ADR2, pin 20) set to ground.

In this setup a master clock is supplied to the device on pin 22 (SCLK). the device can also run with 3-wire I2S by setting the PLL registers as shown in the [Clock Generation and PLL](#) section.

When the device is configured to operate in 3-wire mode of operation where BCLK is used as reference to PLL (NO SCLK), TI recommends shorting PIN23 (BCLK) and PIN22 (SCLK) and configuring the device to use SCLK as PLL reference.

8.2.1.2 Detailed Design Procedure

For the stereo (BTL) PCB layout, see examples in the [Layout](#) section.

A 2.0 system generally refers to a system in which there are two full range speakers without a separate amplifier path for the speakers which reproduce the low-frequency content. In this system, two channels are presented to the amplifier via the digital input signal. These two channels are amplified and then sent to two separate speakers. In some cases, the amplified signal is further separated based upon frequency by a passive crossover network after the L-C filter. Even so, the application is considered 2.0.

Most commonly, the two channels are a pair of signals called a stereo pair, with one channel containing the audio for the left channel and the other channel containing the audio for the right channel. While certainly the two channels can contain any two audio channels, such as two surround channels of a multi-channel speaker system, the most popular occurrence in two channels systems is a stereo pair.

It is important to note that the SmartAmp Flows which have been developed for specifically for stereo applications will apply the same equalizer curves to the left channel and the right channel. This minimizes the needed RAM capabilities of the SmartAmp.

When two signals that are not two separate signals, but instead are derived from a single signal which is separated into low frequency and high frequency by the signal processor, the application is commonly referred to as 1.1 or Bi-Amped systems. The 2.0 (Stereo BTL) System application is shown in [Figure 51](#).

8.2.1.2.1 Gain Setting and Output Switch Frequency

The analog class-D amplifier gain of the TAS576xM is set by the voltage divider connected to the GAIN/FSW control pin. Output Stage switch frequency multiplication is also controlled by the same pin, giving a ratio of 8, 10, 12 or 16x the I2S input sample rate. An internal ADC is used to detect the 8 input states. The first four stages sets the GAIN to 14 dB, while the next four stages sets the GAIN to 20 dB.

A gain setting of 14 dB is recommended for supply voltages of 12V and lower, while a gain of 20 dB is recommended for supply voltages up to 26.4 V. [Table 22](#) shows the recommended resistor values and the state and gain:

Table 22. Gain and FSW

| Ra (to GND) | Rb (to GVDD) | INPUT IMPEDANCE | GAIN | FSW – RATIO TO LRCLK | FSW w. 44.1 kHz | FSW w. 48 kHz |
|----------------|-----------------|--------------------|-------|-------------------------|--------------------|------------------|
| 10 0kΩ | OPEN | 120 kΩ | 14 dB | 8 | 353 kHz | 384 kHz |
| 20 kΩ | 100 kΩ | 120 kΩ | 14 dB | 10 | 441 kHz | 480 kHz |
| 38 kΩ | 100 kΩ | 120 kΩ | 14 dB | 12 | 529 kHz | 576 kHz |
| 47 kΩ | 75 kΩ | 120 kΩ | 14 dB | 16 | 706 kHz | 768 kHz |
| 51 kΩ | 51 kΩ | 60 kΩ | 20 dB | 8 | 353 kHz | 384 kHz |
| 75 kΩ | 47 kΩ | 60 kΩ | 20 dB | 10 | 441 kHz | 480 kHz |
| 100 kΩ | 39 kΩ | 60 kΩ | 20 dB | 12 | 529 kHz | 576 kHz |
| 100 kΩ | 20 kΩ | 60 kΩ | 20 dB | 16 | 706 kHz | 768 kHz |

8.2.1.2.2 Gain Setting and Supply Voltage

If the TAS576xM is to be used in systems operating below 6 V it is recommended to change the maximum DAC output voltage from the nominal 2 V_{rms} FS(0 dB) to 1 V_{rms} FS (–6 dB), by setting register 2 on page 1 D4(Lch) / D0(Rch), [Table 23](#).

Table 23. GAIN and Supply Voltage

| SUPPLY VOLTAGE RANGE | GAIN (via GAIN/FSW pin) | DAC OUTPUT at FS | Page 1 / Register 2 |
|----------------------|-------------------------|--------------------|---------------------|
| 4.5 V – 6 V | 14 dB | 1 V _{rms} | 00010001 |
| 6 V – 12 V | 14 dB | 2 V _{rms} | default |
| 12 V – 26 V | 20 dB | 2 V _{rms} | default |

8.2.1.2.3 DAC to AMP AC Coupling

The TAS576xM uses an external ac-coupling capacitor between DACx output and AMP INPx input and a capacitor from INN_x to ground for minimum dc-offset and click & pop during power on/off. Shown as C13, C14, C19 & C20 in the drawing here.

The AMP INN_{Px} and INN_{Mx} input stage is a fully differential input stage and the input impedance changes with the gain setting from 120 kΩ at 14 dB gain to 60 kΩ at 20 dB gain. The tolerance of the input resistor value is ±20%.

The input ac-coupling capacitor together with the input impedance forms a high-pass filter with the following cut-off frequency:

Figure 52. DAC to AMP AC Coupling

If a flat bass response is required down to 20Hz the recommended cut-off frequency is a tenth of that, 2 Hz.

[Table 24](#) lists the recommended ac-coupling capacitors for the two gain step over a range of desired system high pass filter frequency.

Table 24. F3dB Versus Input AC-Coupling Capacitors

| GAIN | INPUT IMPEDANCE | 0.1 μ F | 0.22 μ F | 0.33 μ F | 0.47 μ F | 1 μ F | 2.2 μ F |
|-------|-----------------|-------------|--------------|--------------|--------------|-----------|-------------|
| 14 dB | 120 k Ω | 13 Hz | 6 Hz | 4 Hz | 3 Hz | 1.3 Hz | 0.6 Hz |
| 20 dB | 60 k Ω | 26 Hz | 12 Hz | 8 Hz | 6 Hz | 2.7 Hz | 1.2 Hz |

The input capacitors used should be a type with low leakage, like film or quality ceramic X5R or X7R with high voltage rating. If a polarized type is used the negative connection should face the DACx output pins. INPx and INMx are biased at 3Vdc.

8.2.1.2.4 Bootstrap Capacitors

The full H-bridge output stages use only NMOS transistors. Therefore, they require bootstrap capacitors for the high side of each output to turn on correctly. A 220-nF ceramic capacitor, rated for at least 16 V, must be connected from each output to its corresponding bootstrap input. See the application circuit diagram in [Smart Amplifier Overview](#).

The bootstrap capacitors connected between the BSxx pins and corresponding output function as a floating power supply for the high-side N-channel power MOSFET gate drive circuitry. During each high-side switching cycle, the bootstrap capacitors hold the gate-to-source voltage high enough to keep the high-side MOSFETs turned on.

8.2.1.3 BTL Application Curves

The following graphs shows the frequency response with different output filter configurations: [Figure 53](#): 4- Ω load with 680 nF and 10- μ H output filter, [Figure 54](#): 4- Ω load with 330 nF and 4.7- μ H inductor. Both setups are using 220 nF for the DAC-to-amp AC coupling capacitor.

Figure 55. Power Efficiency vs Output Power

Figure 56. Power Efficiency vs Output Power

Figure 57. Power Efficiency vs Output Power

Figure 58. Power Efficiency vs Output Power

8.2.2 Mono/PBTL Application

The TAS576xM can be configured in MONO mode enabling up to 100 W peak output power into 2-Ω speaker. This is done by:

- Connect INPL and INNPL directly to GND (without capacitors) this sets the device in Mono mode during power up.
- Connect OUTNR and OUTPR together for the positive speaker terminal and OUTPL and OUTNL together for the negative terminal

In mono mode the right DAC channel, DACR, is used as input for the speaker amplifier, INPR. The left channel DACL can be used for a external AMP if more channels and power is needed.

The combined output can source up to 15A – so be careful to select inductors that can handle that level of current, if inductors with that high saturation current is not available, the PBTL connection can be made after the inductors, this setup is shown in the PBTL application section.

9 Power Supply Recommendations

The TAS576xM requires two power supplies; a low voltage 3.3 V nominal for the pins, AVDD, DVDD and CPVDD and a high power supply, 4.5 V to 26.5 V for the pins PVCC and AVCC.

There is no requirement for sequencing of DVDD and PVCC, either supplies can ramp first.

9.1 AVDD, DVDD, CPVDD Supply

The AVDD Supply is used to power the DAC analog output stage, and needs a well regulated and filtered 3.3-V supply voltage. The DVDD Supply is used to power the digital circuitry for I2S input, I2C input, GPIO blocks and the audio DSP. DVDD needs a well regulated and filtered 3.3-V supply voltage.

9.2 GVDD Supply

The GVDD Supply is used to power the gates of the output full bridge transistors. It is also used to supply the GAIN/FSW voltage divider. Decouple GVDD with a X7R ceramic 1-μF capacitor to GND. The GVDD supply is not intended to be used for external supply. It is recommended to limit the current consumption by using resistor voltage dividers for GAIN/FSW of 100 kΩ or more.

9.3 PVCC, AVCC Power Supply

The TAS576xM high performance class-D audio system requires adequate power supply decoupling to ensure the output total harmonic distortion (THD) and noise is as low as possible.

Optimum decoupling is achieved by placing a good quality low equivalent-series-resistance (ESR) ceramic capacitor larger than 220nF as close to the device PVCC pins and system ground plane as possible.

For filtering lower frequency signals and handling the switching ripple current, a larger aluminum electrolytic capacitor of 470μF or greater placed near the audio power amplifier is recommended. The 470-μF capacitor also serves as a local storage capacitor for supplying current during large signal transients on the amplifier outputs.

10 Layout

10.1 Layout Guidelines

The TAS576xM can be used with a small, inexpensive ferrite bead output filter when speaker are placed with short internal wires and supply voltages are 12 V or lower, for systems with longer wires or higher than 12V supply voltage LC filtering is recommended.

Class-D switching edges are fast and swithced currents are high so it is necessary to take care when planning the layout of the printed circuit board. The following suggestions will help to meet audio, thermal and EMC requirements

- TAS576xM uses the PCB for heatsinking therefore the powerPad need to be soldered to the PCB and adquate cobber area and cobber via's connecting the top, bottom and internal layers should be used.
- Decoupling capacitors — The high-frequency decoupling capacitors should be placed as close to the PVDD and AVCC pins as possible, on the TAS576xM a 1- μ F high-quality ceramic capacitor is used. Large (470 μ F or greater) bulk power supply decoupling capacitors should be placed near the TAS576xM on the PVDD supplies. Local, high-frequency bypass capacitors should be placed as close to the DVDD, AVDD and CPVDD pins as possible.
- Keep the current loop from each of the outputs through the output inductor and the small filter cap and back to GND as small and tight as possible. The size of this current loop determines its effectiveness as an antenna.
- Grounding — A big common GND plane is recommended. The PVDD decoupling capacitors should connect to GND. The TAS576xM power pad should be connected to GND
- Output filter — remember to select inductors that can handle the high short circuit current of the device. The LC filter should be placed close to the outputs. The capacitors used in both the ferrite and LC filters should be grounded

The EVM user guide available on www.ti.com shows both schematic, bill of material and more detailed layout plots including gerber files.

| | |
|-------------|---|
| RSV | Reserved Reserved. Do not access. |
| RSTM | Reset Modules This bit resets the interpolation filter and the DAC modules. Since the DSP is also reset, the coefficient RAM content will also be cleared by the DSP. This bit is auto cleared and can be set only in standby mode. Default value: 0 0: Normal 1: Reset modules |
| RSTR | Reset Registers This bit resets the mode registers back to their initial values. The RAM content is not cleared, but the execution source will be back to ROM. This bit is auto cleared and must be set only when the DAC is in standby mode (resetting registers when the DAC is running is prohibited and not supported). Default value: 0 0: Normal 1: Reset mode registers |

Page 0 / Register 2 (Hex 0x02)

| Reset Value | | | | | 0 | | | | 0 |

| | |
|-------------|---|
| RSV | Reserved Reserved. Do not access. |
| RQST | Standby Request When this bit is set, the DAC will be forced into a system standby mode, which is also the mode the system enters in the case of clock errors. In this mode, most subsystems will be powered down but the charge pump and digital power supply. Default value: 0 0: Normal operation 1: Standby mode |
| RQPD | Powerdown Request When this bit is set, the DAC will be forced into powerdown mode, in which the power consumption would be minimum as the charge pump is also powered down. However, it will take longer to restart from this mode. This mode has higher precedence than the standby mode, i.e. setting this bit along with bit 4 for standby mode will result in the DAC going into powerdown mode. Default value: 0 0: Normal operation 1: Powerdown mode |

| | |
|-------------|--|
| RSV | Reserved Reserved. Do not access. |
| IDFS | Ignore FS Detection This bit controls whether to ignore the FS detection. When ignored, FS error will not cause a clock error. Default value: 0 0: Regard FS detection |

| | |
|-------------|--|
| | 1: Ignore FS detection |
| IDBK | Ignore BCK Detection This bit controls whether to ignore the BCK detection against LRCK. The BCK must be stable between 32FS and 256FS inclusive or an error will be reported. When ignored, a BCK error will not cause a clock error. Default value: 0 0: Regard BCK detection 1: Ignore BCK detection |
| IDSK | Ignore SCK Detection This bit controls whether to ignore the SCK detection against LRCK. Only some certain SCK ratios within some error margin are allowed. When ignored, an SCK error will not cause a clock error. Default value: 0 0: Regard SCK detection 1: Ignore SCK detection |
| IDCH | Ignore Clock Halt Detection This bit controls whether to ignore the SCK halt (static or frequency is lower than acceptable) detection. When ignored an SCK halt will not cause a clock error. Default value: 0 0: Regard SCK halt detection 1: Ignore SCK halt detection |
| IDCM | Ignore LRCK/BCK Missing Detection This bit controls whether to ignore the LRCK/BCK missing detection. The LRCK/BCK need to be in low state (not only static) to be deemed missing. When ignored an LRCK/BCK missing will not cause the DAC go into powerdown mode. Default value: 0 0: Regard LRCK/BCK missing detection 1: Ignore LRCK/BCK missing detection |
| DCAS | Disable Clock Divider Autoselect This bit enables or disables the clock auto set mode. When dealing with uncommon audio clock configuration, the auto set mode must be disabled and all clock dividers must be set manually. Additionally, some clock detectors might also need to be disabled. Default value: 0 0: Enable clock auto set 1: Disable clock auto set |
| IPLK | Ignore PLL Lock Detection This bit controls whether to ignore the PLL lock detection. When ignored, PLL unlocks will not cause a clock error. The PLL lock flag at Page 0 / Register 4, bit 4 is always correct regardless of this bit. Default value: 0 0: PLL unlocks raise clock error 1: PLL unlocks are ignored |

| DTFS[2:0] | Detected FS (Read Only) These bits indicate the currently detected audio sampling rate. 000: Error (Out of valid range) 001: 8 kHz 010: 16 kHz 011: 32-48 kHz 100: 88.2-96 kHz 101: 176.4-192 kHz 110: 384 kHz |
| DTSR[3:0] | Detected SCK Ratio (Read Only) These bits indicate the currently detected SCK ratio. Note that even if the SCK ratio is not indicated as error, clock error might still be flagged due to incompatible combination with the sampling rate. Specifically the SCK ratio must be high enough to allow enough DSP cycles for minimal audio processing when PLL is disabled. The absolute SCK frequency must also be lower than 50 MHz. 0000: Ratio error (The SCK ratio is not allowed) 0001: SCK = 32 FS 0010: SCK = 48 FS 0011: SCK = 64 FS 0100: SCK = 128 FS 0101: SCK = 192 FS 0110: SCK = 256 FS 0111: SCK = 384 FS 1000: SCK = 512 FS 1001: SCK = 768 FS 1010: SCK = 1024 FS 1011: SCK = 1152 FS 1100: SCK = 1536 FS |

| ACRM | Active CRAM Monitor (Read Only) This bit indicates which CRAM is being accessed by the DSP when adaptive mode is disabled. When adaptive mode is enabled, this bit has no meaning. 0: CRAM A is being used by the DSP 1: CRAM B is being used by the DSP |
| AMDC | Adaptive Mode Control This bit controls the DSP adaptive mode. When in adaptive mode, only CRAM A is accessible via serial interface when the DSP is disabled (DAC in standby state), while when the DSP is enabled (DAC is run state) the CRAM A can only be accessed by the DSP and the CRAM B can only be accessed by the serial interface, or vice versa depending on the value of CRAMSTAT. When not in adaptive mode, both CRAM A and B can be accessed by the serial interface when the DSP is disabled, but when the DSP is enabled, no CRAM can be accessed by serial interface. The DSP can access either CRAM, which can be monitored at SWPMON. Default value: 0 0: Adaptive mode disabled 1: Adaptive mode enabled |
| ACRS | Active CRAM Selection (Read Only) This bit indicates which CRAM currently serves as the active one. The other CRAM serves as an update buffer, and can accessed by serial interface (SPI/I2C) 0: CRAM A is active and being used by the DSP 1: CRAM B is active and being used by the DSP |
| ACSW | Switch Active CRAM This bit is used to request switching roles of the two buffers, i.e. switching the active buffer role between CRAM A and CRAM B. This bit is cleared automatically when the switching process completed. Default value: 0 0: No switching requested or switching completed 1: Switching is being requested |

12 Device and Documentation Support

12.1 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

12.2 Trademarks

PurePath, PowerPAD are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

12.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PowerPAD™ PLASTIC SMALL-OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusion not to exceed 0.15.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - F. Falls within JEDEC MO-153

PowerPAD is a trademark of Texas Instruments.

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

PLASTIC QUAD FLATPACK NO-LEAD

4213222/A 11/13

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - QFN (Quad Flatpack No-Lead) Package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

RMT (R-PVQFN-N48)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.
